Idea A — Strike Baskets

Oct 20, 2026 · @mahi

Summary

Strike Baskets turns Strike's stock and pre-IPO perps into one-click themed index funds. A user deposits once into a basket such as "AI Memory" or "Pre-IPO". Our bot holds every market in that basket at set weights inside a Strike vault and keeps it rebalanced.

- **Strike score:** 40 out of 50, the highest of our three ideas
- **Event fit:** 9 out of 10
- **Verdict:** our first choice, provided a teammate can own the trading logic and the testnet vault check passes

Context

Strike's first hackathon rewards builders who bring users, money and volume onto Strike through features nobody else uses. Baskets targets the two biggest unused ones: user vaults and Strike's stock and pre-IPO markets.

What Strike is. Strike Finance is a perpetual futures exchange. It runs its own order book and settles on Cardano, Ethereum and Solana, and users deposit ADA, ETH, SOL or stablecoins. It lists 31 perps, including crypto (BTC, ETH, SOL, ADA), US stocks (NVDA, TSLA, GOOGL, MU, COIN), indexes (S&P 500, NAS100), commodities (gold, silver, WTI oil) and pre-IPO companies (SpaceX as SPCX, Zhipu, Unitree, MiniMax, CXMT). Its biggest day so far had about 500 unique traders.

Lanes already taken. Strike promotes three existing projects. Bolt is a memecoin that copy-trades and pays holders in STRIKE. Strike Copilot is an AI tool for choosing traders to copy. Hizz is a dashboard and AI-trading workspace. None of them use vaults or focus on stock and pre-IPO markets, and that is the gap Baskets fills.

The problem and who has it

People want exposure to a theme, not to manage five leveraged positions by hand. Strike lists unusual markets: AI memory chips, pre-IPO tech, gold and silver. Today the only way to hold a theme on Strike is to open, size and rebalance every perp yourself.

Who has the problem

- **Crypto holders who want stock and pre-IPO exposure** without a brokerage account. Many can't easily buy Zhipu or CXMT anywhere else.
- **Passive users** who would deposit but won't trade actively. Copy trading suits them, but it follows a person, not a theme, and the person can change style overnight.
- **Strike itself:** a platform with about 500 daily traders needs products that bring in money that stays.

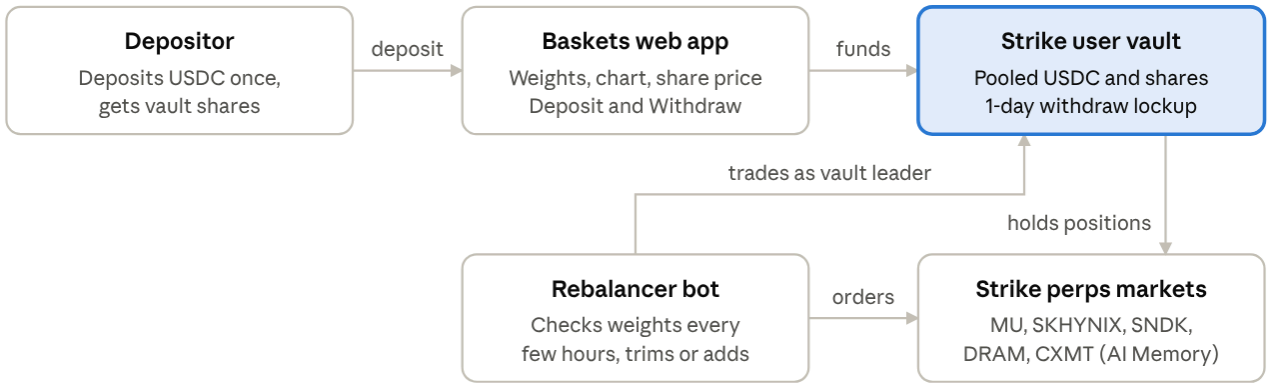

Why today's options fall short

Option	What's missing
Trade each perp manually	Takes time, needs skill, weights drift, and funding costs go unwatched
Copy a trader on Strike	Follows a person's choices, not a stated theme. Hard to know what you hold
The SLP vault	Market-making returns, not exposure to a theme
Tokenised stock ETFs elsewhere	Mostly no pre-IPO names, and not on Cardano or Strike

How it works

One Strike vault per basket. Users deposit into it, and our bot trades it as the vault leader. Strike already provides the vault, the shares and the withdrawal rules. We build the strategy, the bot and the web app.

Depositors fund one Strike vault and our bot trades it as leader

Our fee: a leader commission of 0 to 50% of depositor profits, set under Strike's vault rules

Strike Baskets system · 5 parts

The bot never holds user funds. The money stays in Strike's vault, and the bot only sends orders tagged with the vault's ID.

User flow

1. The user opens the Baskets web app and picks a basket, e.g. "AI Memory" (MU, SK Hynix, SanDisk, DRAM, CXMT at 20% each).
2. The user deposits USDC into that basket's Strike vault (minimum $100 under Strike's defaults) and receives shares at the current share price.
3. The bot opens positions so the vault holds each market at its target weight.
4. Every few hours the bot compares current weights with targets and trims or adds positions when one drifts too far.
5. The share price follows the basket. To exit, the user requests a withdrawal, waits the 1-day lockup, and receives USDC minus our fee on any profit.

Parts and the Strike features they use

Part	What it does	Strike feature
Strike user vault	Holds pooled USDC, issues shares, handles the withdrawal lockup	User vaults
Rebalancer bot	Sizes and places orders, checks weights, applies safety rules	Vault-leader API: orders, batch orders, leverage, margin mode with `vault_id`
Live data	Tracks vault positions, balance and prices in real time	User and market WebSocket streams
Web app	Shows baskets, weights, performance, deposit and withdraw	Public vault endpoints, price history
Markets	The assets inside each basket	Strike's stock, index, commodity and pre-IPO perps

Example baskets

- **AI Memory:** MU, SKHYNIX, SNDK, DRAM, CXMT
- **Pre-IPO:** SPCX, ZHIPU, UNITREE, MINIMAX
- **Hard assets:** XAU, XAG, WTI
- **US Megacap:** NVDA, TSLA, GOOGL, COIN

For the hackathon we run **one** basket live (each account can lead only one vault) and show the others as "coming soon".

Score and verdict

40 out of 50 on Strike's criteria, and 9 out of 10 on event fit. It is strongest on Innovation, Integration and Future Potential, and weakest on how polished we can make it in 48 hours.

Strike's judging criteria (1–10 each, equally weighted)

Criterion	Score	Why
Innovation & Creativity	9	No themed or index products exist on Strike. Pre-IPO baskets are unusual anywhere
Integration with Strike	9	Built on vaults, a Strike feature no other project uses. Can't exist without Strike's markets
Utility & Impact	7	Brings deposits, not just trades. Value grows only once it has a track record
Technical Execution	6	Rebalancing logic and vault handling are the hardest build of our three ideas
Future Potential	9	A fee on growing deposits gives the clearest business case for Strike's investment
Total	**40/50**	

Event fit (0–2 each, from the hackathon-strategist skill)

Check	Score	Why
Sector match	2	Fits Strike's "Automation" and "New applications" examples
Lane	2	No existing project uses vaults or focuses on stock and pre-IPO markets
Format	1	Looks strong in 48 hours, but there's no track record to show
Uses Strike deeply	2	Vaults and Strike's own markets are load-bearing
Post-event path	2	More baskets bring more deposits and fees, with everything live on mainnet
Total	**9/10**	

Why we should choose it

- **Strongest lane:** nobody on Strike uses vaults, and nobody offers stock or pre-IPO baskets.
- **It brings capital to Strike,** which a platform with about 500 daily traders needs most.
- **It shows off Strike's most distinctive asset:** perps on stocks and pre-IPO companies.
- **Clear business model** (the leader fee), which suits the direct-investment prize.
- **A one-line pitch anyone gets:** "one deposit, a whole theme."

Why we should not choose it

- **Hardest build of the three.** Rebalancing, sizing and edge cases take care, and bugs show in a live demo.
- **No track record.** Judges see a two-day-old vault, so we can't claim performance.
- **Costs real money on mainnet:** 100 USDC to create the vault, plus we must keep at least 5% of its shares.
- **One vault per account,** so a second live basket needs a second account.
- **Thin pre-IPO markets** may mean slippage on rebalances.
- **It manages other people's money,** so judges will check the safety rules closely.

Risks, business model and what comes after

Every major risk has a cheap fix if we plan for it on day one. The table pairs each risk with how we handle it.

Risk	How we handle it
Rebalancing bug during the demo	Run on testnet first, add a pause switch, and record the demo from a tested run
Thin liquidity in pre-IPO markets	Launch with the AI Memory basket (MU, SKHYNIX and others), use limit orders, and cap the size per order
Too much leverage, or liquidation	Lock leverage at 1–2x, and set a maximum position size per market
Funding costs eat returns	Show funding paid on the dashboard, and skip markets with extreme funding
Claims judges can't verify	Publish the vault ID, every rebalance log line and the code. Make no performance promises
Vault setup fails on testnet	Fall back to a single-account paper version that shows the same logic, and say so honestly

Business model. Strike lets a vault leader take a commission of 0–50% on depositors' profits, charged only when they withdraw at a gain. A 10% fee on a basket with $500K of deposits earning 10% a year is $5,000 a year per basket. Revenue grows with the number of baskets and deposits.

After the hackathon

- **Month 1:** two or three live baskets on mainnet, a public track record, and safety audits of the bot.
- **Month 2–3:** user-voted baskets, auto-weighting (e.g. by market cap or volatility), and a Telegram channel announcing rebalances.
- **Later:** let other strategists launch their own baskets on our engine, sharing the fee. Strike benefits through new deposits and trading volume, which is exactly what its investment offer looks for.

Before we commit

If the first check fails, we switch to Idea E. Everything else can be fixed during the build.

- [ ] Create a user vault on Strike's testnet and place one order with `vault_id` (decides go / no-go)
- [ ] Check that a vault-led order works on MU, SKHYNIX, SNDK, DRAM and CXMT, and note each market's minimum order size
- [ ] Look at order-book depth on those five markets for a $100–$1,000 rebalance
- [ ] Decide testnet or mainnet for the demo (mainnet needs 100 USDC plus our 5% stake)
- [ ] Ask in Strike's Discord whether a builder vault can be featured or verified
- [ ] Assign the three roles
